November, 2023

2022 City of Kinston Street Condition Survey

Introduction

This report presents the results of the 2022 City of Kinston Street Condition Survey, which has been conducted by City personnel in the Public Services Department. The purpose of this report is to provide a tool to determine the relative condition of our paved city streets. This report can be used in planning maintenance activities and capital improvements, such as resurfacing. Two lists of streets are included, an alphabetical list for easy searches of individual street names, and a list based on the condition rating.

All paved city streets have been included in this survey. The volume of traffic on a road is not reflected in a street's rating. However, each street is classified in one of three categories:

- | | |
|------------------------|--|
| Category 1 (Primary) - | Heavily used streets used primarily for through traffic on a daily basis. Streets must connect other Primary or NCDOT highways. |
| Category 2 (Major) - | Moderate to heavily used streets that connect on at least one end to a Primary street or function as a collector road for large developments. Street should have at least moderate use by through traffic. |
| Category 3 (Minor) - | Lightly used streets, dead end roads, alleys, and small subdivision streets that are typically used only by local property owners. |

In considering streets for maintenance activities, a Category 1 street with the same rating as a Category 3 street should receive preference due to the higher traffic volume and accelerated rate of wear on the surface.

This study does not take into consideration mitigating circumstances that may influence candidates for major repairs or resurfacing, such as subsurface utility problems (including water, sanitary sewer, and storm sewer lines), proposed changes in a street's usage or drainage problems.

Paved streets that have been closed and removed from our Powell Bill listing are presented in a separate table since they will not be considered for resurfacing unless they are reopened.

Survey Rating Methods

Three separate steps were completed to determine each street's rating in this survey. First a complete inventory of city streets was compiled. This began with listing all city streets, divided into sections relevant to traffic patterns and probable resurfacing patterns. Relevant data for each section was collected, including pavement dimensions and category of street.

The second step was for city personnel to ride and inspect every section to determine the pavement condition. Six staff members were used with each staff member completing the one rating category on each street. The same person from our Engineering or Street Section rated the same category on every street. Streets were rated for alligator cracking, transverse/block cracking, rutting, raveling/oxidation, ride quality, and the number of pavement repairs (patches). Streets received a rating of None, Light, Moderate or Severe in each criteria based on its condition.

The last part of the survey was to determine how each rating criteria should influence the overall street condition rating in the sections. After a review and discussion with all field evaluators, a percentage was assigned to each criteria to reflect the importance of that criteria in evaluating the overall street condition. Coefficients were then assigned to the four possible ratings for each criteria. The coefficients reflected how much the score for the street would be reduced based on the rating in the criteria. The worse a street rated, the more its score would be reduced. To check the accuracy of the system in determining the relative condition of one street compared to another, three different formulas were tested. Each formula used different percentages and coefficients. Prioritized lists of the top streets using each method were reviewed by the field evaluators to see which most accurately ranked the street conditions. The following percentage weights and coefficients were deemed the most accurate and used in this final report:

Criteria	Percentage	Coefficients			
		None	Light	Moderate	Severe
Alligator Cracking	25	0	25	60	99
Transverse/Block Cracking	20	0	5	20	35
Rutting	5	0	5	15	25
Raveling/Oxidation	10	0	5	25	35
Ride Quality	20	0	0	10	25
Patches	20	0	5	10	15

A perfect score would be 100 for a street section.

EXAMPLE:

Assume Abbott Street rated as follows: alligator cracking – light, transverse/block cracking – light, rutting – none, raveling/oxidation – moderate, ride quality – light, patches – moderate. The rating for Abbott Street would be:

$$100-(25*0.25)-(20*0.05)-(5*0)-(10*0.25)-(20*0)-(20*0.10) = 88.25$$

Study Results

Based on the formula above, all streets were rated. The second list in this study is in order of the street rating. The lower the score is the worse the street's general condition. The three lowest rated street sections in the City of Kinston are Briarwood Drive from Briery Run Road to Briarcliff Court, Herritage Street from King Street to Blount Street, and Boy Scout Road from Herritage Street to Plaza Boulevard. Five street sections rated below 60. Seventy-seven street sections rated between 60 and 70. In the 2017 survey, no streets were below 60 and nine street sections rated between 60 and 70. Changes in the score for a specific street section would reflect changes in the street's condition, as well as subjective factors, such as the use of different field evaluators in each study.

As a reference point, a street that rated Moderate in every criteria would have a total score of 73.75. A street that rated Light in every criteria would have a score of 91.00. Any street with a rating below 85.00 is in need of some degree of repair. Two hundred seventy-three street sections have a rating of 85 or less.

Conclusions

The total length of the paved streets included in this study is 115.4 miles. This includes all open public streets and does not include paved streets that have been closed to traffic due to flood buyout programs or other reasons. The expected life of a city street can range from 15 years to 30 years depending on the quality of construction, traffic volume, and type of traffic using the street. If we assume the average street will last 25 years before requiring resurfacing or major repairs, then the City should plan to rehabilitate 4% of the total street system each year. This is equivalent to 4.62 miles or 24,372 linear feet per year. Based on recent road improvement projects, the estimated cost to perform street resurfacing is \$25.19 per linear foot, the annual expenditures necessary to maintain city streets would be \$613,930.

Abbreviations (For Street Lists)

AL - Alligator Cracking: Load-associated structural failure which occurs in multiple pavement layers. Can be caused by soft subgrade, insufficient pavement thickness, or drainage

problems. Repairs can include surface patching, full-depth patching, resurfacing or pavement reconstruction.

CAT - Street Category: Based on traffic volume and usage. See Page 1 of this survey

L - Lanes: Number of traffic lanes

LEN - Street Length: Measured in linear feet

PA - Patches: Number of pavement patches due to utility repairs, pothole repairs, or other causes.

RA - Raveling: Raveling is the erosion of the asphalt surface by the loss of asphalt binder and/or aggregate. Causes include weathering, pavement age, and traffic volume.

RQ - Ride Quality: A general indication of what the public would perceive as the condition of the road. Includes the combined effect of all the other pavement distresses, plus dips, humps, or other anomalies that detract from the intended use of the street.

TP - Type: Designation of the street as road, lane, boulevard, street, etc.

TV - Transverse/Block Cracking: Horizontal and longitudinal cracks caused by pavement age and contraction of the pavement. Not typically indicative of structural failure, but does need prompt filling to reduce potential for other distresses that would be caused by water entering the cracks.

W - Street Width: Measured in linear feet
